

SONIM PROTECT PRO

SONIM PROTECT PRO FEATURES

Sonim Protect Pro includes all features of Sonim Protect, plus the following:

Yellow Button

This feature provides proactive monitoring when enabled by your Enterprise Administrator. When activated, the Yellow Button will trigger a check-in timer that may be preconfigured for 5, 10, 15 or 30 minutes. At the end of this period, the end user is notified via tones and an on-screen message that they must explicitly cancel the yellow button or renew the timer for another interval. If neither occurs, Sonim Protect Pro will automatically escalate to a Red Alarm without further user action.

Man-Down Red Alarm

Devices can automatically detect various types of potential worker accidents such as free-fall, impact or non-movement. Using an advanced 3-axis accelerometer, configured by the Enterprise Administrator, Man-Down detection can be activated for specific event types during a specified time window within a 24 hour period. When a Man-Down event is detected, Sonim Protect Pro raises a Red Alarm to the IERCC, who can see what kind of Man-Down event was activated when they contact the worker.

Geofencing

This feature allows Enterprise Administrators to set up safety zones by drawing on a map display and be notified when a user enters or leaves these zones. Use them for emergency assembly points, or for restricted dangerous areas on your worksite.

Enterprise Monitoring Station

This section of the [sonimprotect.com](http://www.sonimprotect.com) website securely displays the location, user identity and status of your workers' safety events on a map. Enterprise Administrators and safety management personnel can actively monitor the status of Red Alarms, Man-Down Red Alarms, active Yellow Button timers, Geofence alerts and Green Button cancelation events to enhance safety responses.
